The flexible and low cost refrigerated van

VebaBox®

THE FLEXIBLE AND LOW COST SOLUTION IN **TEMPERATURE CONTROLLED LOGISTICS**

Converting a standard van into a refrigerated vehicle requires a very long and expensive build process. They are also very expensive to maintain, notorious for excessive downtime, and can be worth very little at the time of resale.

With VebaBox® all of these expensive negatives are now history!

The VebaBox® is an innovative concept whereby a cooling container is inserted into the cargo space of a standard commercial van with a minor modification to the vehicle.

INVESTING IN A VEBABOX® GIVES YOU THE FOLLOWING **ADVANTAGES:**

- > The Vebabox® does not require your van to be insulated, have an engine driven compressor, or a roof mounted condenser. This allows you to quickly add or subtract fleet capacity by (short) leasing vans, as well as greatly increase resale value if you own your vans.
- > It is a fully self-contained cooling box that can be installed or removed from your van in less than a day, and can be re-used when you trade out your vans.
- > The solution features a patent pending cooling unit that completely eliminates downtime! When the cooling unit needs service or recharging, it can be swapped out without tools in two minutes by untrained personnel and sent in for service.
- > The VebaBox® requires only 12V power from your van to hold temperature for the safe transport of your goods.

**THE VEBABOX® IS AVAILABLE IN
A VARIETY OF SIZES;**

**FROM SMALL UNITS UP TO
UNITS THAT FILL THE
WHOLE VAN**

FEATURES OF THE VEBABOX®

- > The Vebabox® can be configured to access through the rear doors, the **side doors**, or both.
- > The VebaBox® can also be equipped with a high capacity **battery unit** or run on **220V** to hold the temperature for shorter and/or longer periods when the van isn't running.
- > The VebaBox® is certified and is designed to hold temperatures from **36° F. - 77° F.**
